Use this report to review your glucose management around mealtimes with your healthcare professional (HCP). Each section for mealtimes are from a time range you would normally eat these meals. For example, from 6AM to 10AM, all your boluses given during this time frame is accounted for under “Breakfast.”

The information above each graph contains average sensor glucose (SG) before (pre-meal) and after (post-meal) a bolus. Remember, not all high glucose events are bad especially after eating, however your glucose values should return to pre-meal range within 3-4 hours after a meal and or bolus.
### Use this Stats column to understand eating habits.

Are you eating more carbs towards the end of the day? Take a look at your Bolus Count, this is a total number of boluses for the entire reporting period, in this example, it is 14 days. The higher the Bolus Count, the likelihood snacking is happening.

Do you have more than one carb ratio for each meal period? Review them with your HCP for appropriateness.

Do you have boluses in the middle of the night? Does this nighttime snacking affect your morning glucose levels? Discuss these questions with your HCP for possible settings adjustments.
### Understanding the Meal Bolus Wizard® Report

Use this side to take notes and write down questions to your HCP for your next visit. This is a good section to write concerns about mealtime glucose events or symptoms you may experience after taking a bolus. This report can help you participate in your diabetes management with your HCP.
